2

New Pulmonary Nodule-12/2013

- 68 y/o ♀
- Severe rheumatoid arthritis
- Takes multiple immunosuppressive medications
- Quit smoking in 2006 (48 years)
- Right lower lobe (RLL) pulmonary nodule noted on pre-surgical workup
- Images from September 2013 showed no RLL nodule (ct scan)

3

Past Medical History

- Bladder cancer
- Hysterectomy
- Cholecystectomy
- Cataract surgery

4

Procedures

- CT of chest w/contrast 12/14/2013
- PET CT scan 12/17/2013
- Demonstrated a 2.5 x 3.3 cm mass at the bottom of the right lower lobe
- Enlarged mediastinal lymph nodes also noted
- Enhanced metabolic activity noted in the large mass and the mediastinal lymph nodes

5

Procedures

- Video Mediastinoscopy 1/4/2014
  - Biopsies collected
  - Frozen sections showed inflammation and necrotizing granulomas
  - Tissue for routine bacterial culture, fungus culture and AFB culture
    - Tissue Gram stain, rare PMNs, NOS
    - AFB stain, NOS

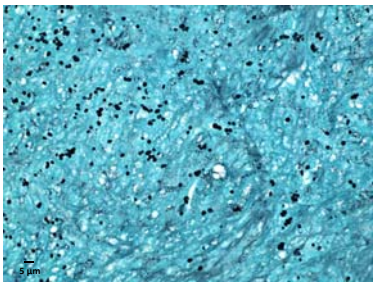
6

Pathology Report of Mediastinal Lymph Node

- Multiple caseating granulomas
- Numerous yeast, 3-4 µm
- Yeast consistent in size

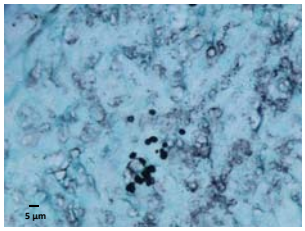
7

Mediastinal Lymph Node GMS Stain 60X



8

Mediastinal Lymph Node GMS Stain 100X



9

Yeast Histopathology

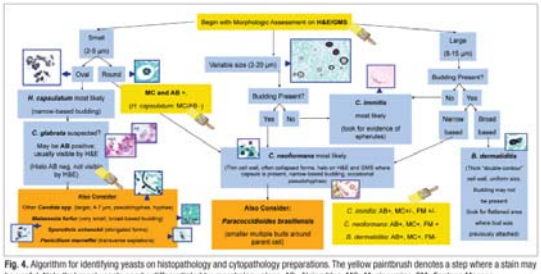


Fig. 4. Algorithm for identifying yeasts on histopathology and cytopathology preparations. The yellow paintbrush denotes a step where a stain may be useful. Note that most yeasts can be differentiated by morphology alone. AB=Alcian blue, MC=Mucicarmine, FM=Fontana Masson.

CAP Today, December 2010, Trail of Clues Leads to Infectious Organisms (Fig. by Dr. Bobbie Pritt, Mayo Clinic)

10

Sensitivity of laboratory tests for diagnosis of pulmonary Histoplasmosis (Percent positive)

Test	Acute or subacute, pericarditis, rheumatological pulmonary,	Chronic pulmonary	Mediastinal
Antigen	25–75	15	0
Fungal stain	10	40	<25
Culture	15	50–85	<25
Serology	95	100	67

Adapted from *TRENDS in Microbiology Vol.11 No.10 October 2003 489.*

In acute pulmonary disease, the sensitivity of antigen detection ranges from about 25% in patients with local manifestations to over 75% in those who present within the first month of exposure.

11

Table 1. Comparison of Diagnostic Tests in All Cases

	Disseminated cases (n = 158)				Pulmonary cases (n = 60)		
All tests	AIDS (n = 56)	OIC (n = 87)	NIC (n = 15)	All (n = 158)	Acute cases (n = 6)	Subacute cases (n = 46)	Chronic cases (n = 8)
Culture	34/48 (70.8)	57/75 (76.0)	7/9 (77.8)	98/132 (74.2)	0/3 (0)	14/26 (53.8)	4/6 (66.7)
Pathology	18/25 (72.0)	32/43 (74.4)	8/8 (100)	58/76 (76.3)	0/2 (0)	8/19 (42.1)	3/4 (75.0)
Antigen	53/56 (94.6) [13.80–7.67][a]	81/87 (93.1) [10.48–7.62]	11/15 (73.3) [6.92–7.65]	145/158 (91.8) [11.32–7.88]	5/6 (83.3) [2.41–2.26]	14/46 (30.4) [0.53–1.23]	7/8 (87.5) [0.93–0.83]
Antibody	15/19 (78.9)	37/53 (71.2)	8/9 (88.9)	60/80 (75.0)	4/6 (66.7)	39/41 (95.1)	5/6 (83.3)

NOTE. Data are no. of patients with positive test results / no. of patients tested (%). NIC, nonimmunocompromised; OIC, other causes of immunocompromise.
[a] Mean antigen concentration, standard deviation in ng/mL. Among the OIC group, antibody tests were positive in 2 (18.2%) of 11 patients who had undergone organ transplantation, 12 (85.7%) of 14 who were receiving tumor necrosis factor antagonists, and 20 (62.5%) of 32 with other causes for immunocompromise.

Table 2. Comparison of Diagnostic Tests in Proven Cases

	Disseminated cases (n = 111)				Pulmonary cases (n = 23)[a]	
Proven tests	AIDS (n = 38)	OIC (n = 62)	NIC (n = 11)	All (n = 111)	Subacute (n = 17)	Chronic (n = 5)
Culture	34/38 (89.5)	57/61 (93.4)	7/8 (87.5)	98/107 (91.6)	14/17 (82.4)	4/4 (100)
Pathology	18/23 (78.3)	32/38 (84.2)	8/8 (100)	58/68 (85.3)	8/12 (66.7)	3/4 (75.0)
Antigen	35/38 (92.1) [14.46–7.34][b]	58/62 (93.5) [11.90–7.44]	7/11 (63.6) [5.11–7.74]	100/111 (90.1) [12.10–7.82]	7/18 (38.9) [0.62–1.23]	4/5 (80.0) [0.63–0.54]
Antibody	9/13 (69.2)	16/19 (84.2)	6/7 (85.7)	41/56 (73.2)	12/13 (92.3)	3/3 (100)

NOTE. Data are no. of patients with positive test results / no. of patients tested (%). NIC, nonimmunocompromised; OIC, other causes of immunocompromise.
[a] None of the acute pulmonary cases were proven.
[b] Mean antigen concentration, standard deviation in ng/mL. Among the OIC group, antibody test results were positive in 2 (20%) of 10 patients who had undergone organ transplantation, 7 (87.5%) of 8 who were receiving tumor necrosis factor antagonists, and 14 (66.7%) of 21 with other causes for immunocompromise.

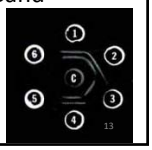
Diagnosis of Histoplasmosis, CID 2011:53, 448-454, Hage et al

12

Laboratory Testing

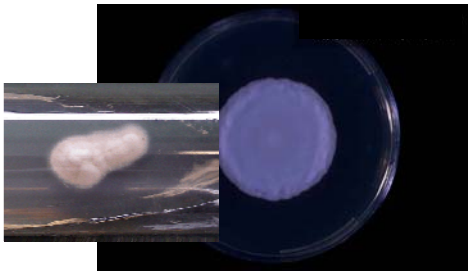
- Histoplasma Urine Antigen – random 2/3/2014, None Detected
- EIA Histoplasma Ab screen - Equivocal
- CF Histoplasma mycelial Ab – negative
- CF Histoplasma yeast - 1:8
- Histoplasma Immunodiffusion – M Band

Sample Immunodiffusion
NOT FROM THIS CASE



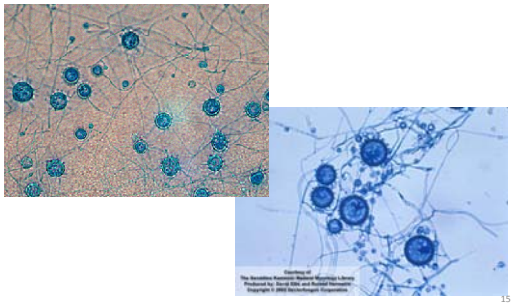
13

Mediastinal Lymph Node Colony After 19 Days of Incubation 30° C



14

Scotch-Tape Preparation of Culture



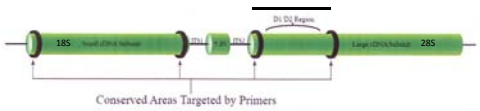
15

Identification of *H. capsulatum*

- SLIDE CULTURES SHOULD NOT BE PERFORMED
- Conversion of filamentous form to yeast form in culture (incubate 37° C)
- Exoantigen test
- DNA probe
- Nucleic Acid sequencing
- MALDI-TOF MS

16

Fungal Sequence Identification



Region of fungal rRNA gene complex PCR amplified and cycle-sequenced by this assay.

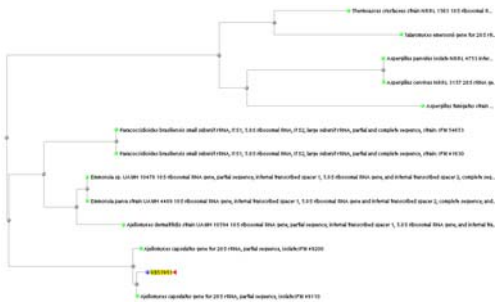
Distance Tree



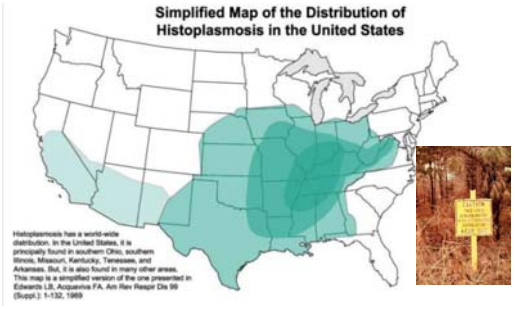
19

Background *Histoplasma capsulatum*

- Single species in genus, 3 varieties of species
- Endemic in the lower Mississippi river valley and Ohio river valley
- Found in soil enriched with guano of various birds or bats, often found around chicken coups
- Spread though inhalation of microconidia in disturbed soil infected with *H. capsulatum*
- Among Medicare beneficiaries, most common endemic mycosis in the US
- Estimated that 500,000 people are newly infected each year in US

20

US Distribution of *H. capsulatum*



21

Hunting for Histo?

22

23

Painful Hip

- 78 y/o ♂
- Widower, lives alone, does have "lady friends"
- Non-insulin dependent diabetes
- Silicosis diagnosed in 1976
- Atrial fibrillation
- Prostate cancer, post seed implantation
- Not immunosuppressed
- Painful loose left total hip (done 1993/ re-done 2008) Fluoroscopy procedure aspirated 1.5 ml clear yellow fluid in February 2011

24

Hip Fluid February 2011

- Cytospin Gram stain
  - rare PMNs, NOS
- Hematology
  - No crystals
  - Nucleated cell count 1,115/µl
  - Differential –
    - 45% PMNs
    - 43% Lymphocytes
    - 3% Monocytes
    - 7% Synovial cells
    - 2% Macrophage

25

Hip Fluid February 2011

- 4 days later culture grew 7 colonies
  - "Very round", small yeast
  - Rapid urea +
  - Rapid trehalose –
  - Set up DNA sequencing

26

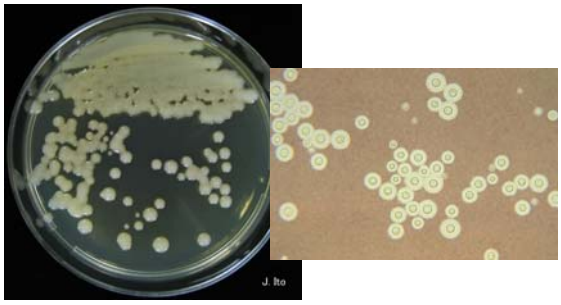
28

Cryptococcus neoformans



29

History March 2011

- March 17 hip hardware removed
  - Replaced with an antibiotic-impregnated temporary femoral stem
  - Tissue collected and submitted for culture
  - Few days later tissue grew rare *C. neoformans*

30

Background *Cryptococcus spp.*

- Genus *Cryptococcus* contains many species (19-30)
- *C. neoformans* and *C. gattii* are the main human pathogens
- *C. neoformans* found in soil enriched with guano from pigeons (and other birds) and aged pigeon guano
- *C. neoformans* worldwide distribution
- *C. gattii* found around flowering *Eucalyptus camaldulenis* trees and coniferous trees native to the pacific northwest
- Spread though inhalation of fungus in disturbed soil infected with *C. neoformans* or plant debris infected with *C. gattii*
- Prior to late 1990's *C. gattii* found predominantly in the tropics and sub-tropics

31

Centers for Disease Control and Prevention
MMWR Morbidity and Mortality Weekly Report
Weekly / Vol. 59 / No. 28 July 23, 2010

Emergence of *Cryptococcus gattii* — Pacific Northwest, 2004–2010

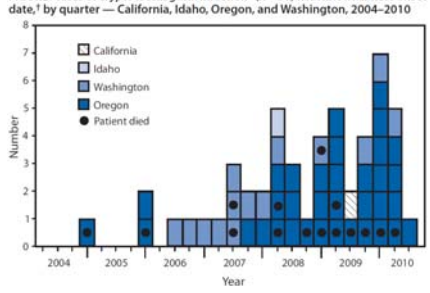
- *C. gattii* previously *C. neoformans var. gattii*
- 1999 *C. gattii* outbreak on Vancouver Island, BC (as of 2007 a total of 218 cases in the area)
- December 2004 a *C. gattii* case in Oregon
- As of July 2011, 96 *C. gattii* cases in Oregon, Washington, Idaho, and California
  - 46 patients had no travel history to Canada

32

North American of Geography of *C. gattii*

33

FIGURE. Cases of *Cryptococcus gattii* infection* (n = 51) with known illness onset date,† by quarter — California, Idaho, Oregon, and Washington, 2004–2010



Source: *Cryptococcus gattii* Public Health Working Group.
* Defined as illness occurring on or after January 1, 2004, in a U.S. resident with a culture-confirmed isolate of *C. gattii*.
† Includes estimated date for one patient each in 2007, 2008, and 2010, and two patients in 2009.

59:865-868, 2010 MMWR

34

Possible Areas Endemic for *Cryptococcus gattii*

35

Differences Between *C. gattii* and *C. neoformans*

Characteristic	*Cryptococcus gattii*	*Cryptococcus neoformans*
Ecological Niche	*Eucalyptus* trees; Native trees of the Pacific NW (e.g. Douglas fir)	Bird Guano
Location	Tropical & subtropical; Pacific NW; possibility for further spread	Worldwide
Immune Status of Host	Immuno-competent (>50%)	Immuno-compromised (>80%)
Lung Manifestations	Commonly nodules	Commonly infiltrates
Brain Lesions	More common	Less common
Hospital Stay and Duration of Therapy	Longer	Shorter

January 18, 2011, ASM

36

Table 2. Laboratory tests for the differentiation of *C. gattii* from *C. neoformans*

Test	Differentiates	Does not differentiate
Serum tests:		
a) Cryptococcus antigen		X (positive for both species)
b) β-1-3-D-glucan		X (negative for both species)
Direct specimen stains:		
a) Gram		X
b) India Ink		X
c) Calcofluor		X
d) Mucicarmine		X
e) GMS		X
Appearance:		
a) Colony morphology		X
b) Cornmeal-Tween 80 morphology		X
c) Temperature and media requirements		X
Commercial biochemical identification systems e.g. VITEK 2 ID-YST, MicroScan		X
Biochemical tests:		
a) Urease		X (positive for both species)
b) Melanin production (phenyloxidase)		X (positive for both species)
c) CBG agar	X	
Serological typing of isolates	X (no longer commercially available)	
PCR	X (target-dependent)	
DNA sequencing	X	

January 18, 2011, ASM

37

L-Canavanine Glycine Bromothymol Blue Agar

FIG. 1. Reactions of various cryptococci on CGB agar. The left plate depicts a positive reaction with *C. gattii*; the middle plate shows a weak reaction around the inoculum, which is interpreted as negative; and the right plate shows a negative reaction with *C. neoformans*.

40

41

I Got Wacked!

- 16 y/o ♂
- In normal state of good health
- Modest acne
- Mows lawns part time
- Presented with an asymptomatic non-healing "skin tag"-like lesion on left index finger

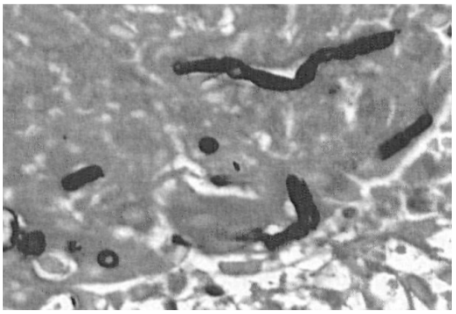
42

I Got Wacked!

- Injured finger while operating a gas powered string trimmer
- Spinning string from rotating trimmer sliced finger (he was operating trimmer)
- Accident occurred about 6 weeks ago
- Original wound healed, but "skin-tag" lesion remained
- "Skin-tag"-like lesion removed and send for histology and bacteria, AFB, and fungal cultures

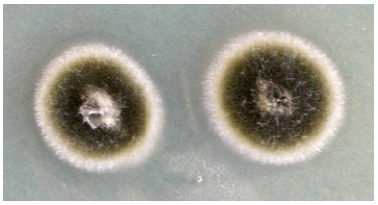
43

"Skin-Tag" GMS Stain 60X



44

"Skin-Tag" Fungal Culture after 4 Days



45

Scotch-tape Preparation of Fungal Culture

Alternaria sp.

46

Table 7. Major Causes of Human Skin, Nail, and Hair Infections by Nondermatophytic Fungi

Skin and Nail Infections	Hair Infections
Acremonium spp.	*Piedraia hortae*
Alternaria spp.	*Trichosporon* spp.
Aspergillus spp.	
C. albicans	
E. dermatitidis	
Fusarium spp.	
Hortaea werneckii	
Lasiodiplodia theobromae	
Neoscytalidium spp.	
Onychocola canadensis	
Pyrenochaeta unguis-hominis	
Scopulariopsis breviculis	

CLSI M54-A, 2012, Principles and Procedures for Detection of Fungi in Clinical Specimens-Direct Examination and Culture; Approved Guideline

47

Background *Alternaria spp.*

- Genus *Alternaria* contains 44 species
- Very common in the environment
- Most are plant pathogens, but a few can be found in the soil
- Commonly considered a saprophytic contaminate of clinical specimens, may occasionally can cause a true infection
- Infections in subcutaneous tissue, eye, nail, skin, nasal sinuses, and peritonitis
- Exposure may play a role in asthma and hypersensitivity pneumonitis
