

Developments in STD testing: *A collaborative discussion for clinicians and laboratorians*

Jessica Dalby, MD
Alana Sterkel, PhD

July 29, 2020

Welcome

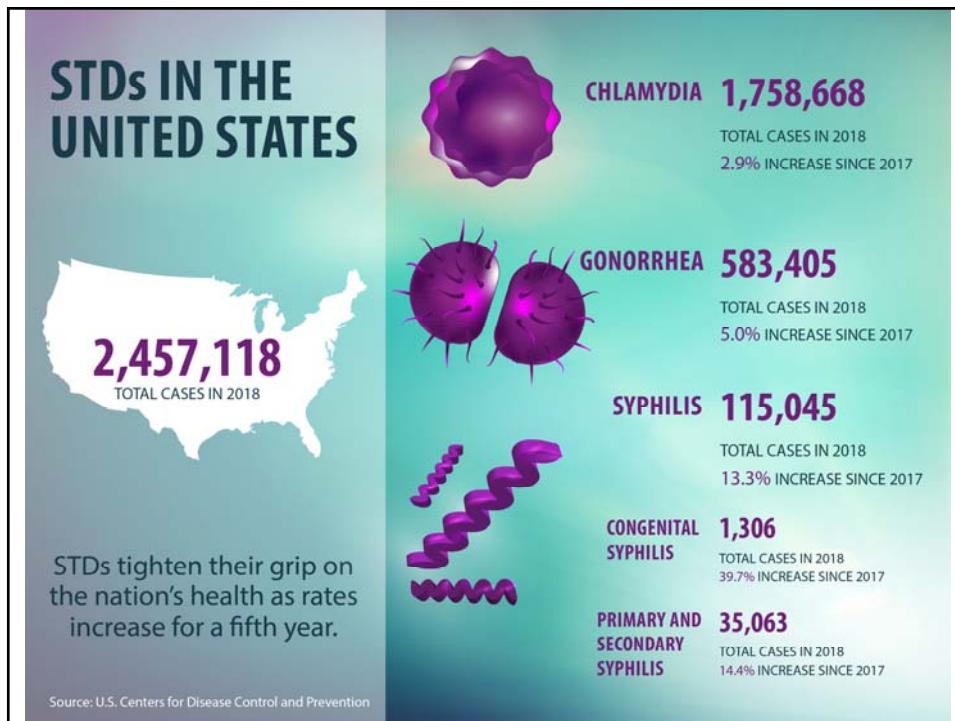

- Welcome to the jointly sponsored Health Care Education and Training (**HCET**) and Wisconsin State Laboratory of Hygiene's (**WSLH**) Wisconsin Clinical Laboratory Network (**WCLN**) webinar - "**Developments in STD Testing - a Collaborative Discussion for Clinicians and Laboratorians**"
 - **Thank you for joining us today!**

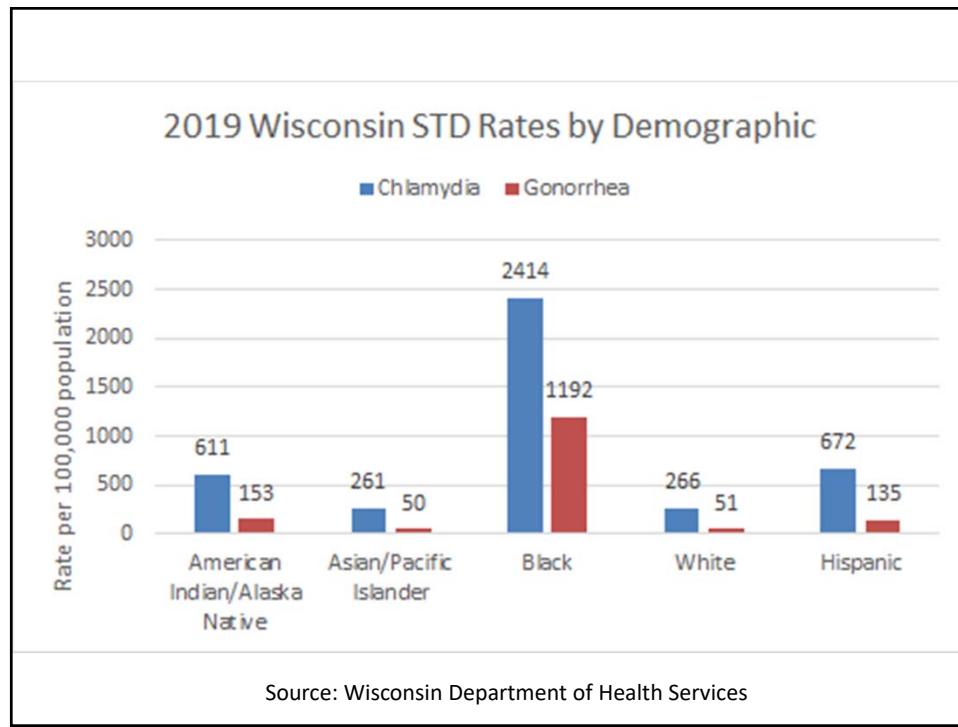

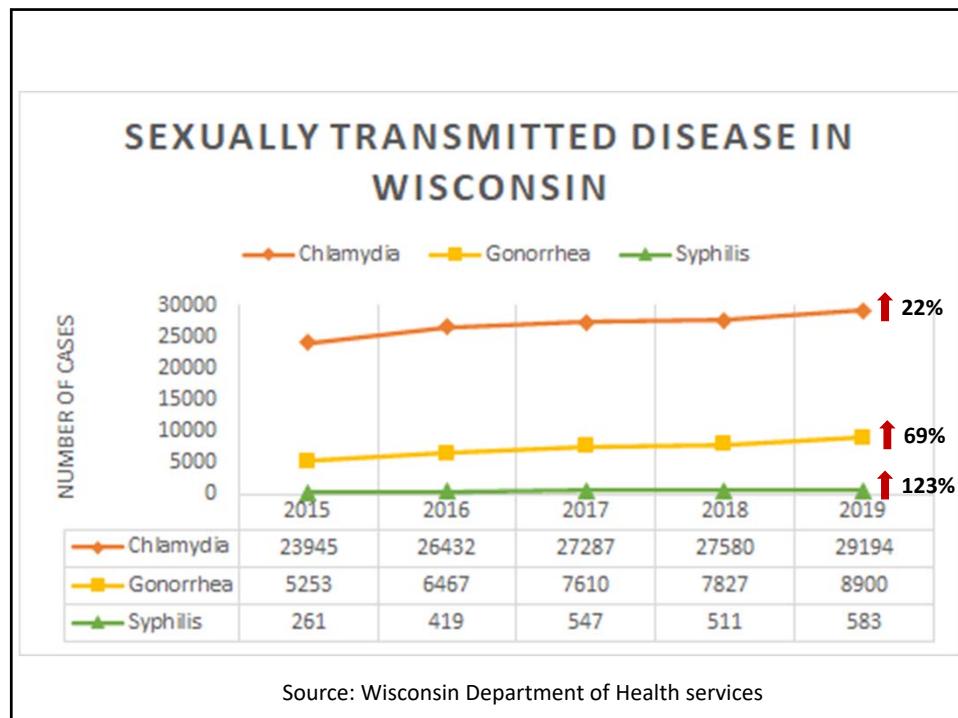

Wisconsin State
Laboratory of Hygiene
UNIVERSITY OF WISCONSIN-MADISON

Objectives

- Discuss the importance of extragenital testing
- Consider implementation of self-collection
- Share the clinical implications and testing strategies for *Mycoplasma genitalium*
- Advocate for testing and treating males with Trichomoniasis
- Review the platforms FDA cleared for this new type of testing

Extragenital

Extragenital testing

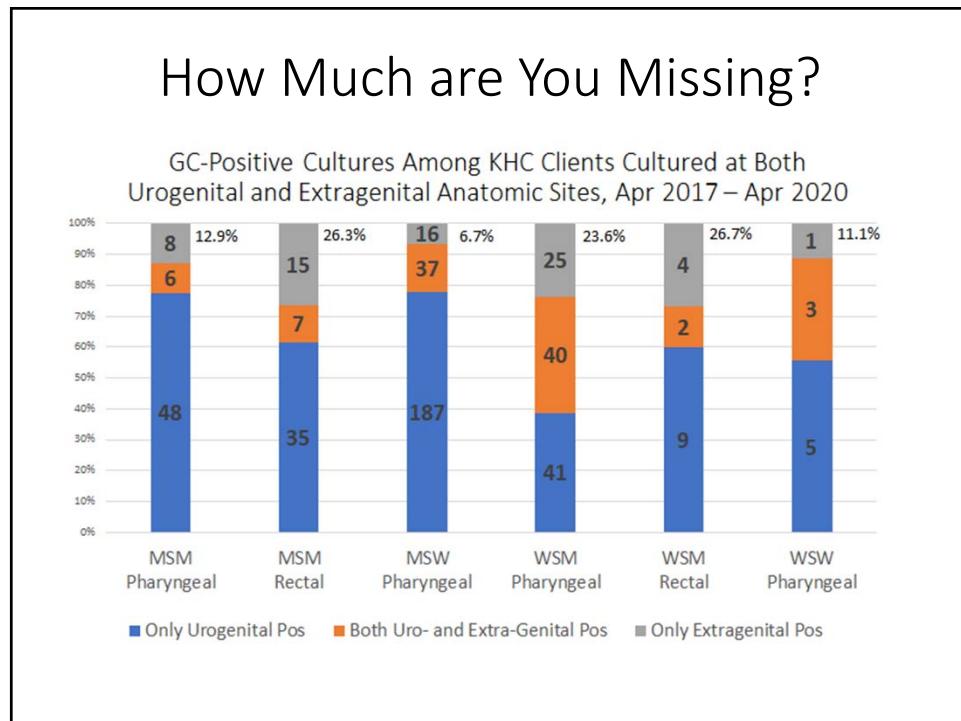

- Definition: Collecting samples from rectum and pharynx
- Remember the 5 “P”s of sexual history
 - Partners
 - **Practices**
 - Protection from STDs
 - Past STDs
 - Pregnancy prevention

MMWR | MSM* & STDs: TEST MORE THAN GENITALS

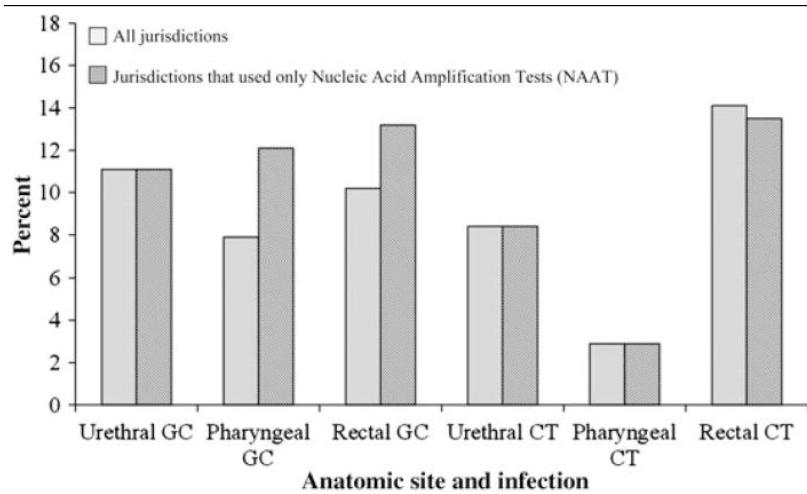

| STDs IN THE THROAT AND RECTUM | OF MSM SCREENED FOR CHLAMYDIA & GONORRHEA**: | SCREEN SEXUALLY ACTIVE MSM FOR STDs! |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> • MSM AT HIGH RISK • OFTEN NO SYMPTOMS • DETECT BY SCREENING • INCREASES HIV RISK  |  <p>1 IN 8 HAD AN STD IN THROAT OR RECTUM</p>  <p>1/3 NOT SCREENED IN LAST 12 MONTHS</p> | <ul style="list-style-type: none"> • AT LEAST 1X/YEAR • HIGHER RISK? EVERY 3-6 MONTHS • IF INDICATED, TEST THROAT & RECTUM  |

Data from National HIV Behavioral Surveillance (NHBS) as published in Johnson Jones et. al. MMWR 2019.
* Men who have sex with men
** MSM recruited from social venues in 5 cities provided data and self-collected swabs
bit.ly/CDQVA24

WWW.CDC.GOV

Extragenital CT and GC

Patton et al. Clin Infect Dis 2014

Oral and Rectal Testing

- CT/GC now FDA approved on 3 different platforms!

- Panther
- Cobas
- GeneXpert

Self collection

Self Collected Vaginal

- 3867 women at an urban sexual health centre (10.2% CT positive)
- Self-collected vulvovaginal swabs were significantly more sensitive than endocervical swabs (97% vs 88%; P<.00001)
- Using endocervical samples rather than vaginal swabs would have missed 9% of infections
- 90% of women found it very easy to self-collect a vaginal swab, and 67% preferred a vaginal swab over a pelvic examination

Sarah A. Schoeman. British Medical Journal. 2012;345:e8013

Self Collected Penile Meatal

- 203 paired urethral and penile meatal self collected swabs
- More infections detected with self-collection
 - CT: 96.8% sens, 98.8% spec.
 - NG: 100% sens, 98.9% spec.
 - TV: 85.0% sens, 96.7% spec.
 - MG: 79.3% sens, 99.4% spec.
- 90.1% of men reported it was easy or very easy and are willing to collect their own swab sample

Diaz et al. Diag. Micro Inf Dis. 2016. <https://doi.org/10.1016/j.diagmicrobio.2016.07.018>

Self Collected Exogenous More people willing to test

- Urban HIV clinic implemented self-testing program for asx clients. Compared testing and yield along with patient acceptability before and after self-testing implemented
- Increased testing: 32% more pharyngeal, 33% more rectal
- Increased detection: 50% more gonorrhea, 47% more chlamydia
- 95% of participants collected samples appropriately
- 92% rated self-testing experience as “good” or “very good”

Barbee et al. Implementation and Operational Research: Effectiveness and Patient Acceptability of a Sexually Transmitted Infection Self-Testing Program in an HIV Care Setting. *J Acquir Immune Defic Syndr*. 2016;72(2):e26-e31.

Self Collected Rectal

- 1458 MSM and 936 women at Dutch STI clinics who report rectal receptive intercourse
- Self-collected versus clinician collected **rectal** sample for NAAT testing
- Results:
 - MSM 11% +CT and 7% +GC, W 9% +CT and 2% +GC;
 - Concordance for CT 98% in MSM and W
 - Concordance for GC 98% in MSM and 99.4% in W
 - 57% MSM and 62% W preferred self swab

van der Helm et al. High performance and acceptability of self-collected rectal swabs for diagnosis of Chlamydia trachomatis and Neisseria gonorrhoeae in men who have sex with men and women. *Sex Transm Dis.* 2009;36(8):493-497.

Self Collected Pharyngeal

- 480 MSM in San Francisco STD clinic
- Self-collected versus clinician collected **pharyngeal** sample for NAAT testing
- Results:
 - 6.7% GC and 1.3%CT
 - Concordance for GC 96.6%
 - Concordance for CT 99.4%

Freeman AH et al. Evaluation of self-collected versus clinician-collected swabs for the detection of Chlamydia trachomatis and Neisseria gonorrhoeae pharyngeal infection among men who have sex with men. *Sex Transm Dis.* 2011;38(11):1036-1039.

Testing by Self Collection

- Many STIs now widely available for self collected vaginal testing!
 - Panther- CT/GC/TV/MG/CV/BV
 - Cobas- CT/GC/TV/MG
 - BD Max- CT/GC/TV
 - BD Viper- CT/GC/TV
 - Alinity M- CT/GC/TV
 - GeneXpert- CT/GC/TV

- Self collected penile meatal now FDA approved
 - Panther- MG
 - Cobas- MG

*No FDA approved oral/rectal self collection yet

What about pooled specimens from multiple sites?

- 489 female sex workers sampled from vagina, rectum and pharynx. After vortex, aliquot from each sample pooled into single vial.
- 6.5% positive CT and 3.5% positive GC
- Testing only vaginal samples would have missed 40% of CT and 60% of GC
- Of 42 positive women on non-pooled sample, only 5 were negative on pooled sample (due to single site infections with low bacterial load)
 - sensitivity of 94% (95% CI 79% to 99%) for CT and 82% (95% CI 57% to 96%) for NG

Verougstraete et al. To pool or not to pool? Screening of *Chlamydia trachomatis* and *Neisseria gonorrhoeae* in female sex workers: pooled versus single-site testing. *Sex Transm Infect.* May 13 2020.

Pooling

- In the right setting this can be useful to maximize limited supplies.
- Pooling dilutes the sample so pools should not have more than 5 samples.
- It can delay the time to report a positive since each positive needs to be tested twice.
- If the disease prevalence is greater than 5% the amount of testing is no longer time or cost effective
- It is challenging for some LIMS to deal with pooling
- Pooling is not approved in current FDA assays.

***Talk to the lab!**

Lab Developed Test

- Requires much more extensive in lab validation
- May require IRB approval for human subject research
- Time consuming and expensive

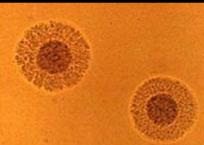

Mycoplasma genitalium

Mycoplasma genitalium: The Basics

- Symptoms similar to chlamydia (NSU, cervicitis)
- Common in urogenital system, also rectum; uncommon in pharynx
- Prevalence in general population 1-2%, in STI clinic attendees 4-38%
- Infection may persist for months or years

Guideline Comparison

| Guideline | USA (2015 - CDC) | Canada (2019?) | European (2016 - IUSTI) | Australian (2018 – ASHM) | British (2018 – BASHH) |
|--------------|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|----------------------------------------|---------------------------|
| Who to test? | Symptomatic men and women (urethritis, cervicitis, PID) | Persistent or recurrent urethritis, cervicitis, or PID despite empiric treatment when initial tests for gonorrhea and chlamydia are negative. | Symptomatic clients (including vaginal discharge) ALSO High-risk sexual behavior ALSO prior to abortion or IUD insertion | Symptomatic clients and their contacts | Symptomatic (NGU and PID) |

M gen Diagnostics

- Gram Stain not useful (no cell wall)
- Culture not useful
 - *M. genitalium* can take up to 6 months grow
 - Requires special media
 - Only a few labs in the world able to grow M gen
- The optimal detection method is molecular
 - Nucleic Acid Amplification Test (NAAT)

| Mycoplasma tests | | | | | |
|------------------|-----------------|------------------------------------|------------------------------------------------------|--------------------------------------------------------------------------------------|------------------|
| Vendor | Platform | Test | Targets | Sample | Status |
| Roche | Cobas 6800/8800 | TIB MOLBIOL | MG/TV | Urine, Swabs (vaginal, self vag., endocervical, meatal, and self meatal) | FDA approved |
| Hologic | Panther | Aptima Mycoplasma Genitalium Assay | MG | Urine, Swabs (endocervical, cervical, vaginal, self vag., urethral, and self meatal) | FDA approved |
| Abbott | Alinity M | STI Assay | CT/GC/TV/MG | Swab (endocervical) | FDA approved |
| BD | BD MAX | Mycoplasma – Ureaplasma OSR | MH/MG/UU/UP | Thin-prep | CE-IVD in Europe |
| BioFire | BioFire | FilmArray STI | CT/GC/TV/MG/UU/UP/ syphilis, H. ducreyii, herpes 1+2 | Urine, Swabs (cervical, vaginal, urethral, ulcer, oral, and rectal) | RUO |
| Bio-Rad | qPCR, multiple | CT/NG/MG Assay | CT/NG/MG | Urine, Swabs (endocervical, vaginal, anorectal, self vag.) | Dev. |
| Diagenode | qPCR, multiple | DIA-MG-050 vs2 | MG/TV | Urine, Swabs (vaginal, urethral) | CE in Europe |
| Pathofinder | qPCR, multiple | RealAccurate TVMGres | TV/MG MG Az Res | Urine, Swabs (vaginal) | CE-IVD in Europe |
| SpeeDx | qPCR, multiple | ResistancePlus MG assay | MG + 5 Res genes | Urine, Swabs (anal, cervical, endocervical, and vaginal) | CE in Europe |

Antibiotic Resistance

- *M. genitalium* lacks a cell wall, and thus antibiotics targeting cell-wall biosynthesis (e.g., beta-lactams including penicillins and cephalosporins) are ineffective against this organism.
- Due to challenges of culture, antibiotic resistance testing not clinically available
- Resistance often detected by treatment failure

Growing Antibiotic Resistance

- Are we increasing the prevalence of antibiotic resistant M gen with presumptive treatment of urethritis (NSU/NGU)?
 - Azithromycin 1g cures 85% in macrolide susceptible infections (more recent study with cure rates of just 40%)
 - Macrolide resistance highly variable, 30-50%, up to 80% in MSM in one Australian study
 - Estimated 10% of susceptible infections develop resistance during treatment course
 - Doxycycline cures 30-40%
 - lowers bacterial burden, does not cause resistance
 - Moxifloxacin cure rate approaches 100% in susceptible infections (more recent studies 89%)
 - Moxifloxacin resistance ~30% in Asia-Pacific region, 10-15% in Australia
- Risk of fluoroquinolones
 - Moxifloxacin cannot be used in pregnancy, and is associated with diarrhea, occasional tendinopathy and rare neurological and cardiac events

<https://www.cdc.gov/std/tg2015/emerging.htm>

Jensen et al. 2016 European guideline on Mycoplasma genitalium infections.

Treatment Guidelines

| Guideline | USA (2015 - CDC) | Canada (2019?) | European (2016 - IUSTI) | Australian (2018 – ASHM) | British (2018 – BASHH) |
|--------------------------|----------------------------------------------------------|-------------------------------------------------|---------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| Initial Treatment | Azithromycin (1g once vs 5-day: 500mg +250mgx4) | Azithromycin 5 day: 500mg + 250mgx4 | Azithromcyin (5 day: 500mg + 250mgx4) OR Josamycin 500mg TID x 10d | Doxycycline 100mg BID x 7d followed by Azithromycin 1g + 500mgx3 | Doxycycline 100mg BID x 7d followed by Azithromycin 1g + 500mgx2 Alternative: Pristinamycin |
| Persistent sx | Moxifloxacin 400mg 7,10 or 14 days | Moxifloxacin 400mg x 7 days (14 days PID) | Moxifloxacin 400mg 7-10 d (14d PID) (3rd line: doxycycline 100mg BID x 14 days) | Doxycycline 100mg BID x 7d followed by Moxi 400mg x 7d | Moxifloxacin 400mg x 10d (14d PID) |

Milwaukee Health Department Data

- 12 Months (March 2019 to February 2020)
 - 1254 **Male patients with urethritis symptoms**
 - 327 + GC (26%)
 - 295 + MG (24%)
 - 228 + CT (18%)
 - 56 + TV (4%)

| Analyte tested | CT | GC | MG | TV | CT/GC | CT/MG | CT/TV | CT/GC/MG | CT/GC/TV | CT/MG/TV | GC/MG | MG/TV | GC/MG/TV |
|----------------|-----|-----|-----|----|-------|-------|-------|----------|----------|----------|-------|-------|----------|
| Positive | 228 | 327 | 295 | 56 | 49 | 43 | 4 | 23 | 3 | 0 | 58 | 4 | 1 |

CT = Chlamydia; GC = Gonorrhea; MG = M Gen; TV = Trichomoniasis

Milwaukee Health Department Protocol

- Clients with NSU/NGU now treated with doxycycline 100mg BID x 7 days as first-line replacing 1g Azithromycin based on higher rate of M gen than Chlamydia in this population at our STD clinic

| Partner Treatment? | | | | | |
|--------------------|-----------------------------|------------------------------------------------------------------------|------------------------------------------------------------------------------|-------------------------------------------------------------|--------------------------------------------------------------------------------------|
| Guideline | USA (2015 - CDC) | Canada (2019) | European (2016 - IUSTI) | Australian (2018-ASHM) *primary care | British (2018-BASHH) |
| Follow up | No TOC | Insufficient data, Maybe in areas of known high prevalence AR | TOC for all patients – no sooner than 3 weeks from tx initiation | TOC – no sooner than 14 days from completion of tx | TOC for all patients 5 weeks (no sooner than 3 weeks) from tx initiation |
| Partner tx? | Consider partner testing | Treat current partners (testing not necessary) | Test and treat OR just treat | Test and treat current partners | Test and treat (OR just treat) |

Controversy: Asymptomatic Screening?

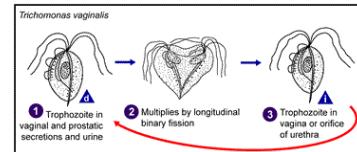

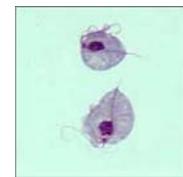

BASHH 2018 Guidelines:

- The evidence suggests that the majority of people infected with M. genitalium in the genital tract do not develop disease.
- Current treatments are imperfect and associated with development of antimicrobial resistance.
- There is no evidence that screening asymptomatic individuals will be of benefit, and indeed is likely to do harm at a population level.

Trichomoniasis

Trichomonas vaginalis

- Flagellated parasite
- Feeds through absorption and ingestion of bacteria
- Can survive in urine, semen, or water for up to 24 hours

Trich Diagnostics

- **Microscopy** used routinely (twitching motility)
 - 1-24 Hours (50-70% sensitive)
- **Culture** often successful and more sensitive
 - 2-8 Days (~80% sensitive), most appropriate in abuse cases
- **Antigen detection** variable, not recommended for asymptomatic women
 - 1-3 Days (67-95% sensitive)
- **Molecular assays** highly sensitive and specific, samples tolerate shipping.
 - 1-3 Days (85-98% sensitive)
- **Antimicrobial susceptibility testing**
 - No guidelines, testing rare at CDC

NAAT for Male Trich

- Urine testing now available on 3 platforms
 - Cobas
 - Alinity M
 - GeneXpert
- Not yet available on urethral swabs

2015 CDC guidelines for TV testing

- Symptomatic women
- Screening in persons living with HIV
- Screening “might be considered” for individuals receiving care in settings with high prevalence (eg, prisons and sexually transmitted disease [STD] clinics) and for individuals engaged in high-risk behaviors (eg, multiple sex partners and illicit drug use)

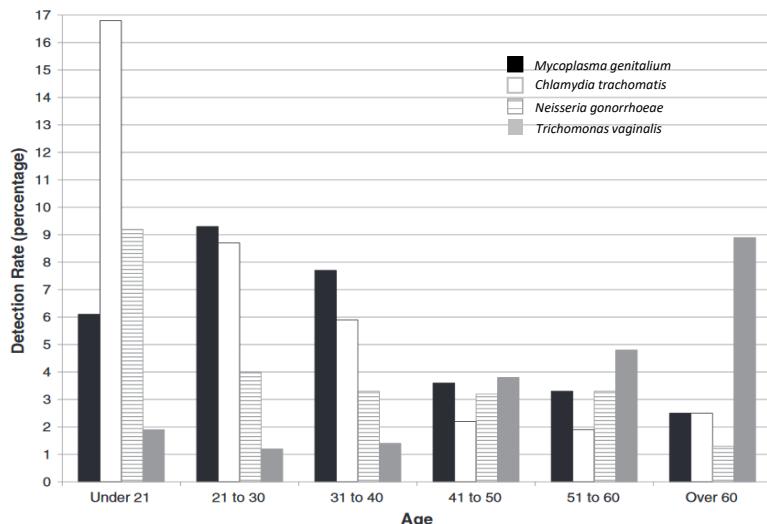

Racial Disparities

- 4057 men and women participating in the 2013–2014 National Health and Nutrition Examination Survey
- Urine sample for Trich NAAT
- Results
 - 71 of 4057 +TV (1.2%)
 - Significant racial disparities: 6.8% black vs 0.4% other

Patel et al. Prevalence and Correlates of *Trichomonas vaginalis* Infection Among Men and Women in the United States. *Clinical infectious diseases : an official publication of the Infectious Diseases Society of America*, 67(2), 211–217. 2018.

STI rates of Men at Milwaukee Clinics

M. Napierala et al. / Diagnostic Microbiology and Infectious Disease 82 (2015) 194–198

Napierala M, Munson E, Wenten D, Phipps P, Gremminger R, Schuknecht MK, Munson KL, Boyd V, Hamer D, Schell RF, Hryciuk JE. Diagn Microbiol Infect Dis. 2015

Milwaukee Health Department Data

- 12 Months (March 2019 to February 2020)
 - 1254 Male patients with urethritis symptoms
 - 327 + GC (26%)
 - 295 + MG (24%)
 - 228 + CT (18%)
 - 56 + TV (4%)

| Analyte tested | CT | GC | MG | TV | CT/GC | CT/MG | CT/TV | CT/GC/MG | CT/GC/TV | CT/MG/TV | GC/MG/MG/TV | GC/MG/TV |
|----------------|-----|-----|-----|----|-------|-------|-------|----------|----------|----------|-------------|----------|
| Positive | 228 | 327 | 295 | 56 | 49 | 43 | 4 | 23 | 3 | 0 | 58 | 4 |

CT = Chlamydia; GC = Gonorrhea; MG = M Gen; TV = Trichomoniasis

Importance of Trichomoniasis Screening and Treatment in Men

- TV infection is strongly linked to an increased risk of human immunodeficiency virus (HIV) acquisition and transmission
- Association with preterm delivery
- Treatment of all sexual partners can prevent recurrences in the index cases, reduce transmission, and prevent new cases in the community.

Testing update at wslh

WSLH Switching to Panther

How does this impact you?

- New collection kits
- New pathogen
 - *Mycoplasma genitalium*
- New sample types
 - Oral and rectal CT/GC
 - Self collected penile meatal for *Mycoplasma genitalium*
 - Male urine for CT/GC and *Mycoplasma genitalium*
 - Clinician collected vaginal- CT/GC/TV/MG
- Faster time to results

Communication

- Webinar
- Updates in the newsletter
- Letters to submitters
- Posted announcements on WSLH webpage
- Updates to the WSLH reference manual
- Presented/handouts at STD Conferences

Summary

- Exogenous testing
 - *If they use it, you should test it! Offer rectal and pharyngeal testing.*
- Self collection
 - *They may be more willing to test and you will find more to treat!*
- *Mycoplasma genitalium*
 - *This is a common cause of urethritis in males. There are serious concerns with antibiotic resistance.*
- Male *Trichomonas vaginalis*
 - *Keep this on your differential for men with symptoms and consider testing high-risk men without symptoms. More prevalent with increasing age, significant racial disparities with higher rates in black people.*
- New FDA testing and update at WSLH

Questions?

Thank You!

- Thank-you to Dr. Dalby and Dr. Sterkel for sharing their expertise on this important subject and giving a wonderful presentation today!
- Thank-you to HCET for partnering with the WCLN to provide today's webinar.
- If you are a WI laboratorian and have any questions after we've concluded today's webinar, you may email Erin Bowles, the Wisconsin Laboratory Network Coordinator at erin.bowles@slh.wisc.edu and she will forward your question to the appropriate speaker.

Archived Presentation

- This webinar has been recorded. It will be posted along with the presentation slides on the WSLH Laboratory Networks and Surveillance Training Events web page for this event within a day or two.
- Here is the link to the web page:
<http://www.slh.wisc.edu/event/wcln-webinar-developments-in-std-testing-a-collaborative-discussion-for-clinicians-and-laboratorians/>

Obtaining ASCLS P.A.C.E. CEU

1. Go to the training event webpage for this event:
<http://www.slh.wisc.edu/event/wcln-webinar-developments-in-std-testing-a-collaborative-discussion-for-clinicians-and-laboratorians/>
2. Click on the link to the "ASCLS CE Organizer" website.
3. Click on the correct box for "Member" or "Non-Member".
4. Login to your account or create an account.
5. Click on "Claim Credit" at the top of the page.
6. Click on the "ASCLS State and Regional Events tab.
7. Scroll down to ASCLS-Wisconsin and click on "View Region".
8. Click on the blue box to the far right for this webinar event.
9. Scroll to the bottom of the list of offerings and click on "Next".
10. Enter the code **2558** and click on "Next".
11. Complete the program evaluation and click on "Complete Survey".
12. Click on "Download Certificate Now" and save or print your certificate.
